

Abstract

A method and device for modulating cardiac control. The method comprises selecting waveforms from a storage area that are representative of body organ function. The selected waveforms are then transmitted to a treatment member, which is in direct contact with the body, either internally or externally, and which then broadcasts the waveforms to a cardiac control regulatory points within the body to modulate cardiac pacing. A control module is provided for transmission to the treatment member. The control module contains the waveforms which are selected and transmitted to the treatment member, and computer storage can be provided for greater storage capacity and manipulation of the waveforms.
